With the combination of dilatometry, thermal analysis, and electron metallography, demarcation was made of the bainitic domains in steels with 0.2% C, containing either 1.3 to 1.9% Mn, or 0.03 to 1.5% Mo. The TTT curves thus obtained are valuable when the steel is

We show first of all, with reference to a polystyrene, that the inclination of the flex point line is not influenced by the solvent while the state of solution remains constant. This inclination, as a deviation from the horizontal position observed in the case of linear macromolecules, can only be interpreted as a deviation from linear structure. We then demonstrate with the use of linear polyacrylonitrile and differently branched poly-
